

Central Tendency- Data Analysis & the information

	sl_no	ssc_p	hsc_p	degree_p	etest_p	mba_p	salary
Mean	108.0	67.303395	66.333163	66.370186	72.100558	62.278186	288655.405405
Median	108.0	67.0	65.0	66.0	71.0	62.0	265000.0
Mode	1	62.0	63.0	65.0	60.0	56.7	300000.0

Information from above data is:

1. The dataset shows that most academic scores (SSC, HSC, degree, MBA) are clustered in the mid-60s range.
2. The **mean values** for these percentages are all around ~66–67%, indicating overall consistent academic performance across stages.
3. The **median values** are very close to the means, suggesting the data is fairly symmetric
4. The **mode values** are slightly lower (e.g., SSC ~62%, HSC ~63%), which implies that the most frequently occurring scores are below the average—this could indicate a slight concentration of students scoring in the lower-mid range.

Salary shows more variation:

- Mean salary is higher than the median
- This indicates a right-skewed distribution, where a few high salaries are pulling the average up
- The mode suggests a common salary bracket but not necessarily representative of most individuals

Overall insight:

1. Academic performance is stable and normally distributed
2. Employability scores are slightly stronger
3. Salaries are not evenly spread-A few people earn **much higher salaries**, which pulls the average up
